Annexure: AI Use Declaration

Project: RELAY AEGIS, evidence-driven self-healing · Hackathon 2026 (Sentry × Dezyne E'cole College) · github.com/krieger-geist/relay-aegis

Every AI tool used for the project is listed below. AI was used as an assistance and development support tool; the final implementation, decisions, testing, verification, and submission were performed and checked by the participant.

AI tool	What I asked it to do	What I wrote, changed or checked myself
ChatGPT	Help with system architecture, technical reasoning, planning, debugging guidance, documentation, explanations, demo planning, and refining implementation approaches.	I made the final architecture and implementation decisions, wrote/modified code, integrated components, tested the system, verified failure and recovery scenarios, reviewed outputs, and decided what was actually included in the submission.
Claude	Assist with codebase inspection, targeted implementation, UI work, testing, regression checks, documentation, and preparing presentation/video graphics.	I reviewed the proposed changes, directed the implementation, tested the resulting features, checked the UI and system behaviour, validated the evidence, and made the final decisions about the project and demonstration.
Gemini (Google)	Help create and refine visual graphics for the project. Inside RELAY AEGIS itself, Gemini is an optional component that adds a clearly labelled AI hypothesis when an API key is set.	Chose which graphics to use and where, checked them against the real system, and kept Gemini in the product advisory only: it never takes an action, authorises a recovery or marks anything resolved, and the deterministic engine works without it.
faster-whisper (open-source speech-to-text)	Transcribe my recorded camera takes, to find the right take for each video section and to time the video subtitles.	Recorded all footage myself, checked and corrected every subtitle line against my script, and chose the takes used in the final video.
Overall AI assistance	Approximately 50–60% of the development work involved AI assistance for coding, technical guidance, debugging, documentation, and presentation preparation.	Approximately 40–50% was human-led work, including problem definition, architecture decisions, integration, manual testing, verification, troubleshooting, review, demonstration decisions, and final submission responsibility.

Declaration: I confirm that this entry is my own work, that every AI tool used is listed above, and that I can explain and demonstrate the parts of the submitted project. AI assistance was used substantially, but the final work was reviewed, integrated, tested, and verified by me.
